Antifolate - Wikipedia

Antifolates are a class of antimetabolite medications that  
antagonise the actions of folic acid. Folic acid's primary  
function in the body is as a cofactor to various  
methyltransferases involved in serine, methionine,  
thymidine and purine biosynthesis. Consequently,  
antifolates inhibit cell division, DNA/RNA synthesis and  
repair and protein synthesis. Some such as proguanil,  
pyrimethamine and trimethoprim selectively inhibit  
folate's actions in microbial organisms such as bacteria,  
protozoa and
