There have been previous reviews on the identification of the cystic fibrosis gene (Tsui and Buchwald 1991; Tsui 1995). To avoid repeating all that has been said, we have decided to provide only a historical account of key developments as well as factors that contributed to the CF gene identification.

Cystic fibrosis (CF) is an autosomal recessive genetic disorder in which there are mutations in both copies of the gene encoding the cystic fibrosis transmembrane conductance regulator (CFTR) protein (1, 2). Mutations of the CFTR protein affect chloride ion channel function (3), causing abnormally high secretory viscosity.
